First thorough treatment of multidimensional item response theory. Description of methods is supported by numerous practical examples. Describes procedures for multidimensional computerized adaptive testing.

This book is an introductory text to the field of psychological testing primarily suitable for undergraduate students in psychology, education, business, and related fields. This book will also be of interest to graduate students who have not had a prior exposure to psychological testing and to professionals such as lawyers who need to consult a useful source. Psychological Testing is clearly written, well-organized, comprehensive, and replete with illustrative materials. In addition to the basic topics, the text covers in detail topics that are often neglected by other texts such as cross-cultural testing, the issue of faking tests, the impact of computers and the use of tests to assess positive behaviors such as creativity.

Revised and updated edition of graduate level overview, describing biological basis of behaviour and personality.

This handbook surveys clinical and educational considerations related to the foundations, models, special topics, and practice of psychological assessment.

This volume presents findings from recent research focusing on young people and the way they relate to religion in their education and upbringing. The essays are diverse and multidisciplinary - in terms of the religions they discuss (including Christianity, Islam and Sikhism); the settings where young people reflect on religion (the classroom, youth club, peer group, families, respective religious communities and wider society); the different perspectives which relate to religious education and socialisation (the teaching of RE, the role of teachers in pupils’ lives, the way teachers’ personal lives shape their approach to teaching, school ethos and social context, and the place and rationale of RE); the contexts within which the authors work (different national settings and various academic disciplines); and the methodology used (qualitative, quantitative and mixed-method approaches). The authors make important contributions to the debate about the role of religious education in the curriculum. They demonstrate the crucially important formative influence of religious education in young people’s lives which reaches well into their adulthood, shaping religious and other identities, and her attitudes towards the ‘other’ - whatever that ‘other’ may be. This book was originally published as a special issue of the Journal of Beliefs & Values.

Biological Bases of Individual Behavior contains a mixture of papers from East and West. The book can be organized into two parts. The articles in the first part, which might broadly be termed “physiological”, examine a number of questions relating to the physiological constitution and to methods of measuring the properties of the nervous system. This section opens with one of Teplov’s last papers, which contains a lucid exposition of the main results of research carried out in 1964 in the laboratory he directed. The other articles in this section elucidate the use of electroencephalographic and Chronometric methods of studying the properties of the nervous system; examine problems of sensitivity and “partiality” in the manifestation of the basic properties; and present the results of experiments conducted to study the correlations between certain properties of the nervous system and features of the human constitution, as well as between age and neurodynamic factors. The second part of the volume may be described as psychophysiological. It consists of articles which examine the possible physiological mechanisms of individual psychological features of behavior. Many are devoted to either experimental or theoretical analysis of the neurophysiological bases of the personality dimension of extraversion-introversion.

Throughout the world as in the United States, psychologists are increasingly being called upon to evaluate clients whose backgrounds differ from their own. It has long been recognized that standard personality and psychopathology assessment instruments carry cultural biases, and in recent years, efforts to correct these biases have accelerated. The Handbook of Cross-Cultural and Multicultural Personality Assessment brings together researchers and practitioners from 12 countries with diverse ethnic and racial identities and training to present state-of-the-art knowledge about how to minimize cultural biases in the assessment of personality and psychopathology. They consider research methodology, the design and construction of standard objective and projective tests, the use of measures of acculturation, racial identity, and culture-specific tests, the social etiquette of service delivery, and the interpretation of test data for clinical diagnosis. Ranging widely through all the relevant issues, they share a common collective vision of how culturally competent services should be delivered to clients. The Handbook offers the first comprehensive view of a consistent approach to cultural competence in assessment—a necessary precursor of effective intervention. It will become an indispensable reference for all those whose practice or research involves individuals with different ethnic and racial identities.
The comprehensive and authoritative Handbook of Personality Psychology is the end-all, must-have reference work for personality psychologists. This handbook discusses in detail the development and measurement of personality, personality traits, the origins of personality, the nature of personality, the relationship between personality and behavior, the relationship between personality and cognition, the relationship between personality and emotion, the relationship between personality and social behavior, the relationship between personality and health, the relationship between personality and sex, the relationship between personality and culture, and the relationship between personality and evolution. The handbook is divided into three parts: measurement, assessment, and conceptual perspectives. The measurement part covers the history and development of personality measurement, the measurement of personality traits, the measurement of personality processes, and the measurement of personality structures. The assessment part covers the use of personality assessments, the use of personality assessments in clinical settings, and the use of personality assessments in educational settings. The conceptual perspectives part covers the conceptual foundations of personality psychology, the conceptual challenges of personality psychology, and the conceptual future of personality psychology.
personality would have reached an advanced state much earlier had such a collaboration been the rule rather than the exception in studies of this kind. Both disciplines benefit by working together on the many problems they have in common. Eysenck had in conjecture his belief that his research was a test of his belief from opposite ends of the psychology spectrum when he first began work on this book. He goes on to explain the basis from which Dimensions of Personality developed. Central to any concept of personality, he states, must be hierarchies of traits organized into a dimensional system. The two major dimensions he posited, neuroticism and extraversion, were in disfavor with most scientists of personality at the time. Now they form part of practically all descriptions of personality. Dimensions of Personality is a landmark study and should be read by both students and professionals in the fields of psychiatry, psychology, and sociology.

Acknowledging and understanding spiritual formation is vital in contemporary education. This book explores the dynamic relationship between education and wellbeing. It examines the theory underpinning the practice of education in different societies where spirituality and care are believed to be at the heart of all educational experiences. The book recognizes that, regardless of the context or type of educational experience, education is a caring activity in which the development of the whole person -- body, mind, and spirit -- is a central aim for teachers and educators in both formal and informal learning. The chapters in this handbook present and discuss topics that focus on spirituality as an integral part of human experience and, consequently, essential to educational programs which aim to address personal and communal identity, foster resilience, empathy and compassion, and promote meaning and connectedness.

Measures of Personality and Social Psychological Constructs consists of busy researchers and practitioners by identifying and reviewing the best scales/measures for a variety of constructs. Each chapter discusses test validity, reliability, and utility. Authors have focused on the most often used and cited scales/measures, with a particular emphasis on those published in recent years. Each scale is identified and described, the sample on which it was developed is summarized, and reliability and validity data are presented, followed by presentation of the scale, in full or in part, where such permission has been obtained. Measures fall into five broad groups. The emotional dispositional section reviews measures of general affective tendencies, and/or cognitive dispositions closely linked to emotion. These measures include hope and optimism, anger and hostility, life satisfaction, self-esteem, confidence, and affect dimensions. Emotion regulation scales go beyond general dispositions to measure factors that may contribute to understanding and managing emotions. These measures include alexithymia, empathy, resiliency, coping, sensation seeking, and ability and trait emotional intelligence. The interpersonal styles section introduces some traditional social-psychological themes in the context of personality assessment. These measures include adult attachment, concerns with public image and social evaluation, and forgiveness. The vices and virtues section reflects adherence to moral standards as an individual characteristic shaped by sociocultural influences and personality. These measures include values and moral personality, religiosity, personality characteristics (e.g., psychopathy, narcissism, and subclinical psychopathy), and perfectionism. The sociocultural interaction and conflict section addresses relationships between different groups and associated attitudes. These measures include cross-cultural values, personality and beliefs, intergroup contact, stereotyping and prejudice, attitudes towards sexual orientation, and personality across cultures. Encompasses 25 different areas of psychological research Each scale has validity, reliability info, info on test bias, etc Multiple scales discussed for each construct Discussion of which scales are appropriate in which circumstances and to what populations Examples of scales included

Is the question of God still relevant for our time? Empirical studies from an international perspective show the fact that there are both indications of God's importance and disappearance. The articles in this book deal with questions related to the content, structure and function of images of God. The studies document the actual variety and forms of religious practice and highlight the issues of God present - out of necessity from an ecumenical and interdisciplinary point of view. If and how the question of God is asked is not only of denominational interest, but is also of a cultural importance for the individual and public life in Europe. The empirical studies in this collection were discussed at the "Wurzburg Research Days - Practical Theology" in December 2000.

Investigating the hitherto unexplored topic of how young people understand and relate to religious diversity in the social context in which they are growing up, this book makes a significant contribution to the existing body of literature on religious diversity and multiculturalism. It closes a gap in knowledge about young people's attitudes to religious diversity, and reports data gathered across the whole of the UK as well as comparative chapters on Canada, USA and continental Europe. Reporting findings from both qualitative and quantitative research which reveal, for example, the importance of the particular social and geographical context within which young people are embedded, the volume addresses young people's attitudes towards the range of 'world religions' as well as non-religious stances and offers an interdisciplinary approach through the different analytical perspectives of the contributors.
